**INTERFLEX**

## COMPANY PRESENTATION

INTERFLEX was founded in 1967 with a clear target in mind: innovation in cable protection and management. We were pioneers in the Spanish market introducing a wide range of metal conduits and cable accessories. Several years later, we were the first company to introduce a cable protection system made of polyamide conduits and fittings in our country. We were also one of the first local cable tray producers, and on the VIATEC range we introduced the first self-coupling cable tray manufactured in Spain.

All this experience has allowed us to become specialists on flexible conduits and cable management systems.

INTERFLEX is a family owned company where the second generation has already taken an active and leading role, to continue developing its activities in a highly competitive and demanding business climate and to ensure the fulfillment of all its worldwide customers' expectations.

Today, the enterprise's innovation spirit is more alive than ever, and it can be seen through our company's product line features. During the last 5 years, the company has heavily invested in new manufacturing processes to improve its global performance. This also includes the creation of our logistics centre a few years ago, with a fully automated warehouse allowing us to provide second to none fast and reliable deliveries to our customers worldwide.

## PRESENTACIÓN DE LA COMPAÑÍA

*INTERFLEX fue fundada en 1967 con un claro objetivo: la innovación en los sistemas de protección y conducción de cables. Fuimos pioneros en el mercado Español en la introducción de una amplia gama de tubos metálicos y accesorios de cables. Varios años después, fuimos la primera compañía en introducir un sistema de tubos y racores de poliamida para la protección de cables en nuestro país. Asimismo, fuimos uno de los primeros fabricantes de bandeja portacables locales, y en la gama VIATEC introdujimos la primera bandeja enchufable fabricada en España.*

*Toda esta experiencia nos ha permitido convertirnos en especialistas en sistemas de tubería flexible y en sistemas de conducción de cables.*

*INTERFLEX es una empresa familiar donde la segunda generación ha tomado ya un papel activo de gestión para continuar desarrollando sus actividades en un entorno de mercado altamente competitivo, con el objetivo de cumplir con las expectativas de sus clientes alrededor del mundo.*

*Hoy, el espíritu innovador de la empresa está más vivo que nunca, visible en las características de los productos que configuran nuestra gama. Durante los últimos 5 años, la compañía ha invertido en nuevos sistemas productivos para mejorar su respuesta global, incluyendo la creación hace algunos años de nuestro centro logístico. Su almacén totalmente automático proporciona entregas rápidas y fiables a nuestros clientes a nivel mundial.*

INTERFLEX is the manufacturer of the MULTIVIA cable tray range, which includes the VIAFIL wire-mesh tray system and the VIATEC sheet steel tray system. They offer a solution for most of the installations that require a cable management system.

The company is also a renowned manufacturer of cable protection systems under the NYLOFIX (polyamide system) and INTERFLEX (metal and PVC system) brand names. In its home country, INTERFLEX also distributes a wide selection of electrical products from well-known and high quality international brands to provide a complete solution for the electrical installer needs in a broad variety of market sectors.

The excellence of our products and our wish to enlarge our scope of customers drove the company to start with the exportation activity more than 10 years ago. During this time, we have been able to establish a wide loyal and satisfied distribution network in more than 38 countries in 5 continents.

Being a family owned company, we like to have a close and direct relationship with our customers and partners around the world. Our clients and their satisfaction are and will continue to be the reasons why INTERFLEX staff strives to improve its activity on a day to day basis.

Our long term strategy is aimed at being a trusted and reliable partner for cable protection and management systems.

**MULTIVIA®**

*INTERFLEX es el fabricante de la gama MULTIVIA de bandejas portables, la cual incluye el sistema de bandejas de rejilla VIAFIL y el sistema de bandejas de chapa perfilada VIATEC. Esta oferta cubre las necesidades de buena parte de las instalaciones que requieren de sistemas de conducción de cables.*

*INTERFLEX también fabrica el reconocido sistema de poliamida para la protección de cables NYLOFIX y el sistema de tubo metálico y de espiral de PVC INTERFLEX. A nivel nacional, INTERFLEX distribuye asimismo una amplia selección de productos de calidad para el sector eléctrico de reconocidas marcas internacionales para proporcionar una solución integral para las necesidades de los instaladores eléctricos en una extensa variedad de mercados.*

*La calidad de nuestros productos y el deseo de ampliar nuestro abanico de clientes llevó a la compañía a empezar la actividad de exportación hace más de 10 años. Durante este tiempo, hemos podido establecer una red de distribución estable en más de 38 países en 5 continentes.*

*Por el hecho de ser una empresa familiar, nos gusta tener una relación cercana y directa con nuestros clientes y colaboradores alrededor del mundo. Su satisfacción es y continuará siendo la razón por la cual el equipo de INTERFLEX se esfuerza a diario en mejorar su actividad.*

*Nuestro objetivo a largo plazo es ser un proveedor fiable y de confianza de sistemas para la protección y conducción de cables.*

## SYSTEM INTRODUCTION

The **VIAFIL** system is formed of electro welded wire-mesh cable trays, complemented by a wide range of accessories to fulfill the most diverse and demanding installations.

The main advantages of this type of tray are its big open surface (which allows a high ventilation of the cables installed), its light weight and its high versatility. Due to its morphology, this type of trays can be cut and bent to shape and assemble them according to the installation needs, adding flexibility to overcome any unexpected change during the assembly. Thanks to the INSTA-FIX option found on some of its supports' range, the **VIAFIL** trays can be fixed over them without the need to use any bolt or lock nut. This makes the assembly process faster and easier, which means a reduction on the overall installation cost.

The **VIATEC** system is composed of sheet steel cable trays and a vast accessory range to adapt the assembly to the different installation needs. The clever self coupling system, offered as standard in the whole tray range\*, decreases the assembly time and provides a safe and sturdy connection. **VIATEC** is available in perforated and solid bottom versions. The latter, when used with a cover, offers the possibility to increase the protection against the access of foreign objects to the cables on the installation, which is important for some specific locations.

\*except illumination cable trays

## INTRODUCCIÓN AL SISTEMA

*El sistema VIAFIL está formado por bandejas portacables de rejilla electrosoldada, complementada por una amplia gama de accesorios para satisfacer los más variados y exigentes tipos de instalación. Las principales ventajas de este tipo de bandeja son su gran superficie libre (permitiendo un elevado nivel de ventilación a los cables instalados), su peso ligero y su gran versatilidad. Debido a su morfología, este tipo de bandeja puede ser cortada y doblada para modelarlas de acuerdo a las necesidades de la instalación, añadiendo flexibilidad para superar cualquier imprevisto durante el proceso de montaje. Gracias a la opción INSTA-FIX presente en parte de su gama de soportes, las bandejas VIAFIL pueden ser fijadas sobre ellos sin la necesidad de utilizar tornillos o tuercas. Esto proporciona un proceso de montaje más fácil y rápido, lo que conlleva una reducción en el proceso global de instalación.*

*El sistema VIATEC está compuesto de bandejas de acero laminado y de una vasta gama de accesorios para adaptar el montaje a las necesidades de instalación. El ingenioso sistema enchufable, presente en toda la gama\*, reduce el tiempo de montaje y proporciona una conexión segura y resistente. VIATEC está disponible en versiones perforadas y ciegas. Cuando son utilizadas con tapa, éstas últimas incrementan la protección frente a la entrada de cuerpos extraños a los cables de la instalación, lo cual es importante para ciertas localizaciones.*

\*excepto bandejas de iluminación

## MARKETS AND APPLICATION AREAS

The VIAFIL and VIATEC cable tray systems are used in a wide range of industrial applications. Below are the most representative ones:

- Industrial construction
- Civil construction
- Safety installations (fire resistant)
- Renewable energy installations (windmills, solar plants, ...)
- Machine tool industry
- Other applications

The criteria to choose one type of system or another are diverse. The main ones are as follows:

- Installation conditions and laws (could be different for each country)
- Load capacity
- Access vulnerability (IP rating)
- Corrosion resistance (environment)
- Versatility
- Aesthetic

The information found in this catalogue will help you on making the correct selection. Nevertheless, we remind you that you can contact our Technical Assistance service directly at [asist-tecnica@interflex.es](mailto:asist-tecnica@interflex.es), who will gladly aid you in case you have any doubt or question about any aspect of the installation.

## MERCADOS Y ÁREAS DE APLICACIÓN

Los sistemas de bandejas VIAFIL y VIATEC se utilizan en un amplio rango de aplicaciones industriales. A continuación se indican los más relevantes:

- Obra industrial
- Obra civil
- Instalaciones de seguridad (resistencia al fuego)
- Energías renovables (molinos eólicos, plantas solares,...)
- Maquinaria
- Otras aplicaciones

Los criterios para escoger un tipo de sistema u otro dentro de las aplicaciones indicadas son numerosos. Los principales son los que siguen a continuación:

- Condiciones de instalación y legales (pueden ser distintos en cada país)
- Capacidad de carga
- Vulnerabilidad frente a la entrada de agentes externos (grado IP)
- Resistencia a la corrosión (ambiente)
- Versatilidad
- Estética

La información contenida en este catálogo les ayudará a realizar una correcta selección. De todos modos, les recordamos que pueden contactar con nuestro servicio de Asistencia Técnica directamente en [asist.tecnica@interflex.es](mailto:asist.tecnica@interflex.es), el cual les ayudará en caso que tengan dudas o preguntas sobre cualquier aspecto de la instalación.

## Industrial construction

This sector covers a wide variety of installations, from manufacturing facilities to power plants, and for this reason the cable management requirements will be extremely diverse. The broad possibilities that can be found on the MULTIVIA range give a solution to this request. The environmental conditions, for example, can also be very different depending on the type of application. For example, in a food industry installation there can be areas with extremely acid agents, while other areas can have a neutral atmosphere. Therefore, the wide range of finishes offered on the MULTIVIA range play an important role here.

## Obra industrial

Este sector cubre una gran variedad de emplazamientos, desde fábricas hasta plantas de producción de energía, y por este motivo los requisitos para los sistemas de conducción de cables serán igual de heterogéneos. El amplio abanico de posibilidades de la gama MULTIVIA ofrece la solución. Las condiciones ambientales, por ejemplo, pueden ser muy diferentes dependiendo del tipo de aplicación. En una instalación de la industria de alimentación puede haber zonas con agentes muy ácidos, mientras que otra zona puede presentar una atmósfera neutra. Las diferentes posibilidades de acabado de la gama MULTIVIA toman especial relevancia en estos casos.

## Civil construction

From hospitals to commercial buildings, civil construction shares a lot of similarities with the industrial construction sector. There are two aspects that set it slightly apart, though.

The first one is the amount of people these types of buildings gather. This means that all the systems involved, including the cable management systems, must be not only reliable but also safe. Another difference is that recent legal requirements on public buildings have specified the need for halogen free and low fire hazard characteristics for the different systems installed on most of these areas. Both VIAFIL and VIATEC systems offer solutions to comply with all these requirements.

It is also important to note that this sector normally has tight lead times that require a quick delivery service. INTERFLEX has the production and logistics capacity to provide a fast and reliable supply of all the necessary goods.

## Obra civil

Desde hospitales hasta centros comerciales, la obra civil comparte muchas similitudes con el sector industrial. De todos modos, hay dos aspectos que lo diferencian.

El primero es la cantidad de personas que estos tipos de edificios albergan normalmente. Esto significa que todos los elementos implicados, incluyendo los sistemas de conducción de cables, no sólo deben ser fiables, sino también seguros. Otra diferencia es que recientemente los requisitos legales en edificios públicos especifican la necesidad de productos libres de halógenos y de baja emisión de humos para los distintos sistemas instalados en la mayor parte de sus áreas. Tanto los sistemas VIAFIL como VIATEC ofrecen soluciones para cumplir con todos estos requisitos.

Es importante destacar que este sector requiere normalmente de plazos ajustados que requieren de un servicio de entrega ágil. INTERFLEX dispone de los procesos productivos y logísticos para ofrecer una entrega rápida y eficaz del material necesario.

## Safety installations

These types of installations are becoming more and more present, especially on buildings that need a lot of time to be vacated in case of fire. For this reason, they need to maintain critical electrical devices (such as fire pumps, emergency lighting, ...) operative for as many minutes as possible to give enough time to evacuate the people and for the firefighters to control the fire.

The most widely used standard to evaluate the effects of a fire over a cable management system is the DIN 4102-12 (Fire resistance of electric cable systems required to maintain circuit integrity - Requirements and testing). Both VIAFIL and VIATEC systems have been tested according to this standard and have been homologated as E90, which means that the safety systems would be operative for more than 90 minutes. A special range of accessories are offered to make the assemblies to achieve this target.

## Instalaciones de seguridad

Este tipo de instalaciones están siendo cada vez más presentes, especialmente en edificios que requieren de un tiempo largo de evacuación en caso de incendio. Por este motivo, deben mantener los equipos eléctricos críticos (bombas de agua, señalización de emergencia, ...) operativos durante tantos minutos como sea posible de modo que proporcionan tiempo suficiente para desalojar a las personas y para que los bomberos puedan controlar el fuego.

La norma más utilizada para evaluar los efectos del fuego sobre un sistema de bandejas portacables es la DIN4102-12 (Resistencia ante el fuego de los sistemas de cables eléctricos para mantener la integridad del circuito-Requisitos y ensayo). Los sistemas VIAFIL y VIATEC han sido ensayados de acuerdo con esta norma y han obtenido la homologación E90, lo que significa que los sistemas de seguridad permanecen operativos durante más de 90 minutos. Una gama especial de accesorios permite realizar los montajes para conseguir este objetivo.

## Renewable energy installations

Spain currently ranks 3rd in the world on energy generation and on production of power installations from renewable sources. Hydraulic, and more recently windmill, photovoltaic and thermo solar installations have experienced an amazing growth in the past years. From the same country, INTERFLEX is providing cable management solutions for all these applications worldwide.

Alstom, Gamesa or Iberdrola are some of the companies that rely on our MULTIVIA products for their installations.

## Machine tool industry

This sector needs a high reliability level. Any problem on the installation integrity means a time-consuming replacement, which results in a loose on efficiency and a waste on money. The MULTIVIA range offers different solutions for the requirements of this industry.

## Energías renovables

*España está actualmente en el 3<sup>er</sup> puesto mundial en generación y producción en plantas de energía de fuentes renovables. Instalaciones hidráulicas, y más recientemente eólicas, fotovoltaicas y solares han experimentado un crecimiento espectacular en los últimos años. Desde el mismo país, INTERFLEX proporciona soluciones de conducción de cables para todas estas aplicaciones a nivel mundial.*

*Alstom, Gamesa o Iberdrola son algunas de las compañías que confían en los productos MULTIVIA para sus instalaciones.*

## Maquinaria

*Este sector requiere de un grado de fiabilidad muy elevado. Cualquier problema en la integridad del sistema puede significar una laboriosa reparación, lo que resulta en una pérdida de eficiencia y un coste añadido. La gama MULTIVIA ofrece distintas soluciones para los requisitos de este mercado.*

## Other applications

All the applications described cannot cover the whole range of installations where our VIAFIL and VIATEC systems can be used. If you have doubts whether our cable management systems can be used on a particular installation, our INTERFLEX Technical Assistance service will gladly help you.

Moreover, even though our product range is very wide we know that some applications require special solutions. Thanks to our production flexibility and technical skills, we can offer special tailor-made solutions, such as special tray lengths, sizes or even specific pieces and finishes. Please, contact our INTERFLEX Technical Assistance service for more information about its availability.

INTERFLEX Technical Assistance service  
asist.tecnica@interflex.es

## QUALITY

INTERFLEX is in conformity with the ISO 9001 quality standard, which yearly certifies the correct internal running of the company.

The products included in our VIAFIL and VIATEC ranges have been submitted to the most demanding tests according to the IEC 61537 standard for cable management systems to give you peace of mind when choosing our products.

After performing several tests on the UL laboratories, the VIAFIL system has also been given the UL CLASSIFIED mark

The MULTIVIA range has also obtained the E90 homologation for fire resistance according to the DIN4102-10 standard (Fire resistance of electric cable systems required to maintain circuit integrity - Requirements and testing). In order to provide a system with the highest safety standards, the tests have been done by an independent certification company supervised by INTERFLEX.

INTERFLEX has its own in house laboratory for testing and developing the products, as well as its own quality control management system.

## CALIDAD

INTERFLEX cumple con el estándar de calidad ISO 9001, el cual certifica el correcto funcionamiento interno de la compañía.

Los productos incluidos en nuestra gama VIAFIL y VIATEC han sido sometidos a las más pruebas más exigentes de acuerdo con la norma CEI 61537 para los sistemas de conducción de cables para proporcionar la máxima confianza en nuestros productos.

Después de varios ensayos realizados en los laboratorios de UL, el sistema VIAFIL también ha obtenido la homologación UL CLASSIFIED

La gama MULTIVIA también ha obtenido la homologación E90 de resistencia al fuego de acuerdo con la norma DIN4102-10 (Resistencia ante el fuego de los sistemas de cables eléctricos para mantener la integridad del circuito-Requisitos y ensayo).

Para proporcionar un sistema con la máxima seguridad, los ensayos han sido realizados por una empresa certificadora independiente supervisados por INTERFLEX.

INTERFLEX dispone de su propio laboratorio para el ensayo y desarrollo de sus productos, así como su propio sistema de gestión de calidad.

## Otras aplicaciones

Todas las aplicaciones descritas no pueden cubrir todas las instalaciones donde los sistemas VIAFIL y VIATEC pueden ser utilizadas. Si tienen dudas sobre si nuestros sistemas de conducción de cables pueden ser utilizados en una instalación en particular, puede recurrir a nuestro servicio de Asistencia Técnica.

Asimismo, aunque nuestra gama de producto es amplia, puede que en ocasiones sean necesarias soluciones especiales. Gracias a la flexibilidad de nuestros procesos productivos y nuestros conocimientos técnicos, podemos ofrecer soluciones a medida, como dimensiones especiales de bandeja, o incluso piezas y acabados específicos. Contacten nuestro servicio de Asistencia Técnica para más información sobre su disponibilidad.

Servicio de Asistencia técnica de INTERFLEX

# Multiadvantages cable trays

## Bandejas multiventajas

Self coupling sheet steel cable tray  
Bandeja enchufable de acero laminado

### speed

### rapidez

Self-coupling ends allow a quick and easy installation.

Su sistema enchufable permite un montaje más rápido, seguro y eficiente

### versatility

### versatilidad

Multiple holes for ventilation and fastening of the conductors.

Multitud de troquelados para la ventilación y fijación de los conductores.

### ease of fixation

### facilidad de fijación

A great number of holes on the whole length of the cable tray ensure the coincidence with the ones of the supports.

Un gran número de troquelados en toda la bandeja aseguran su coincidencia con los de los soportes.

Lateral holes for coupling elements and conduction accessories.

Troquelados laterales para los elementos de unión y fijación de accesorios

### protection

### seguridad

Rounded and closed edges for the complete protection of the installers and the conductors.

Bordes redondeados y cerrados para total protección de los montadores y de los cables

Central holes for fixing complementary elements.

Troquelado central para fijar elementos complementarios

### care

### cuidado

A rounded protection at the base of the cable tray protects the cables from damage while pulling.

Rebujo que facilita el deslizamiento de los cables en las uniones de bandejas.

### guarantee

### garantía

Cable tray and accessories identified with our tradenames.

Bandejas y accesorios identificados con nuestras marcas.

### strength

### resistencia

Reinforced base and wings with longitudinal and traverse profiles that enable the fixation of the cover without accessories.

Base y alas reforzadas con perfilados longitudinales y embutidos que permiten, además, la fijación de la tapa sin accesorios.

### comfort

### comodidad

Inlaid fitters to hide the bolts and guarantee an obstacle free traction and distribution of the cables.

Alojamientos embutidos para los tornillos que garantizan la tracción y la distribución de los conductores, sin obstáculos.

### fire resistant

### resistente al fuego

E90 classification acc to DIN 4102 - 12 standard for fire resistance

Clasificación E90 s/norma DIN 4102-12 para resistencia al fuego

| Unión lateral INSTA-FIX                         |    |
| Unión base INSTA-FIX .....                      | 20 |
| Pletina de unión multiuso                       |    |
| Brida fijación VIAFIL a soporte                 |    |
| Brida fijación tabique separador a VIAFIL ..... | 21 |
| Borne de tierra para bandeja VIAFIL             |    |
| Tenaza de corte asimétrico en ángulo            |    |

## Ejemplos de conformado y ensamblaje

|                        |    |
|------------------------|----|
| Curvas 90° .....       | 22 |
| Cambios de nivel ..... | 25 |
| Derivaciones .....     | 26 |
| Reducciones .....      | 27 |

## Soportes y elementos de soporte

|                                                           |    |
|-----------------------------------------------------------|----|
| Soporte INSTA-FIX para salida de cables .....             | 28 |
| Soporte multiuso INSTA-FIX                                |    |
| Soporte caja derivación .....                             | 29 |
| Soporte distanciador                                      |    |
| Soporte INSTA-FIX para VIAFIL 60 x75 .....                | 30 |
| Soporte multiuso INSTA-FIX para VIAFIL 60 x 60 y 60 x 100 |    |
| Soporte central para VIAFIL                               |    |
| Soporte multiuso para VIAFIL 60x75 .....                  | 31 |
| Soporte central y placa fijación VIAFIL 60x75             |    |
| Soporte teleraíl para suspensión en trapecio              |    |
| Soporte INSTA-FIX para suspensión en trapecio .....       | 32 |
| Cabezal varilla suspensión                                |    |
| Clip fijación horizontal .....                            | 33 |
| Clip fijación vertical                                    |    |
| Mordaza fijación a viga                                   |    |
| Soporte "Omega" para pared o perfil colgante .....        | 34 |
| Soporte "Omega" para techo                                |    |
| Soporte perfil "Omega" para suspensión en trapecio ....   | 35 |
| Perfil "Omega" colgante                                   |    |
| Tope soportes perfil "Omega"                              |    |
| Soporte para pared o perfil "C" .....                     | 36 |
| Soporte INSTA-FIX para pared o perfil "C" .....           | 38 |
| Soporte compacto para pared o perfil "C" .....            | 40 |
| Perfil "C21" (41 x 21 mm) .....                           | 42 |
| Perfil "C21" con pletina                                  |    |
| Doble perfil "C21" con pletina .....                      | 43 |
| Perfil "C41" (41 x 41 mm)                                 |    |
| Cabezal recto para perfiles "C" .....                     | 44 |
| Cabezal inclinable para perfil "C41"                      |    |
| Rótula para perfil "C41"                                  |    |
| Tuerca-guía para perfil "C" .....                         | 45 |
| Tornillo hexagonal para tuerca-guía                       |    |
| Varilla roscada para suspensión                           |    |
| Tuerca-arandela dentada                                   |    |
| Tornillos con tuerca-arandela dentada                     |    |

## Sheet steel VIATEC cable tray

|                                                                                                                           |    |

When covering 60 & 110 side trays, use ULR06.. side coupler.  
Para fijación de la tapa en alas de 60 y 110 utilizar la unión lateral ULR06..

To separate electrical networks  
of different characteristics  
Para la separación de redes eléctricas  
de características diferentes

## Multipurpose coupler Unión multiuso

| Reference<br>Referencia | Weight/Peso<br>kg/u | u<br>pack |
|-------------------------|---------------------|-----------|
| <b>UURZ3</b>            | 0,03                | 50        |
| <b>UURG</b>             | 0,03                | 50        |
| <b>UURI</b>             | 0,03                | 50        |

For coupling 2 cable tray lengths side 30 you will need:

- Width 100: 2 pcs. UUR..
- Widths 200-300: 3 pcs UUR..

For coupling 2 cable tray lengths side 60 you will need:

- Widths 60-100-150: 2 pcs. UUR..
- Widths 200-300: 3 pcs UUR..
- Widths 400-500-600: 4 pcs UUR..

Para unir dos tramos de bandeja ALA 30 utilizar:

- Ancho 100: 2 uniones UUR..
- Anchos 200 y 300: 3 uniones UUR..

Para unir dos tramos de bandeja ALA 60 utilizar:

- Anchos 60 - 100 y 150: 2 uniones UUR..
- Anchos 200 y 300: 3 uniones UUR..
- Anchos 400 - 500 y 600: 4 uniones UUR..

### Coatings | Acabados:

| PCB100G                 | 1000 | 2,57                | 1         |

When using SHE..., SSH... or SEC... supports, fix them with 2 TE1020G bolts and 2 TG10G guided lock nuts.  
When using SO... supports, fix them with 2 TE835G bolts, 2 TG8G guided lock nuts and 2 TSOG shims.

En caso de utilizar soportes SHE..., SSH... ó SEC..., fijarlos mediante 2 tornillos TE1020G y 2 tuercas guía TG10G.  
En caso de utilizar soportes SO..., fijarlos mediante 2 tornillos TE835G, 2 tuercas guía TG8G y 2 topes TSOG.

When using SHE..., SSH... or SEC... supports only on one side, fix them with 2 TE1020G bolts and 2 TG10G guided lock nuts.  
When using SHE..., SSH... or SEC... supports with even loads on both sides, use 2 TE1070G bolts and 2 C6923.10G guided lock nuts.  
When using SO... supports, fix them with 2 TE835G bolts, 2 TG8G guided lock nuts and 2 TSOG shims.

En caso de utilizar soportes SHE..., SSH... ó SEC..., fijarlos mediante 2 tornillos TE1020G y 2 tuercas guía TG10G.  
En caso de utilizar soportes SHE..., SSH... ó SEC... con carga equilibrada, utilizar 2 tornillos TE1070G y 2 tuercas C6923.10G.  
En caso de utilizar soportes SO..., fijarlos mediante 2 tornillos TE835G, 2 tuercas guía TG8G y 2 topos TSOG.

# Elements for supports

## Elementos de soporte

### Straight head plate for "C" profiles

### Cabezal recto para perfiles "C"

| Reference<br>Referencia | Weight/Peso<br>kg/u | u<br>pack |
|-------------------------|---------------------|-----------|
| <b>CPCG</b>             | 1,57                | 1         |

For applications with PC.. profile, use 2 TCA1025G bolts.  
For applications with PRC.. Profile, use 2 TE1070G bolts  
with 2 C6923.10G lock nuts.  
En caso de utilizar perfil PC.., utilizar 2 tornillos TCA1025G.  
En caso de utilizar perfil PRC.., utilizar 2 tornillos TE1070G  
y 2 tuercas C6923.10G.

### Tiltable head plate for "C41" profile

### Cabezal inclinable para perfil "C41"

For vertical hanging with inclinations up to 60° in both directions.  
Para péndulos verticales con inclinaciones hasta 60° en ambas direcciones.

| Reference<br>Referencia | Weight/Peso<br>kg/u | u<br>pack |
|-------------------------|---------------------|-----------|
| <b>CICS</b>             | 0,51                | 1         |
| <b>CICG</b>             | 0,58                | 1         |

(1) For predefined configurations with angles of 0°, 15°, 20°, 25°, 30°, 40°, 45° and 60° use 2 TE1070G bolts with C6923.10G toothed lock nuts.  
(2) For configurations on mounting holes with angles from -2° to 60° use 1 TE1070G bolt with a C6923.10G lock nut as an axis, plus 2 TCA1020G bolts on the mounting holes (with the lock nuts facing outwards).  
(1) Para configuraciones predefinidas con ángulos de -2°, 15°, 20°, 25°, 30°, 40°, 45° y 60°, utilizar 2 tornillos TE1070G con tuercas C6923.10G.  
(2) Para configuraciones en colisos con ángulos de -2°, hasta 60°, utilizar 1 tornillo TE1070G como eje con 1 tuerca C6923.10G, juntamente con 2 tornillos TCA1020G en los colisos (con las tuercas orientadas hacia fuera del cabezal).

### Joint for "C41" profile

### Rótula para perfil "C41"

**NEW**  
**NOVEDAD**

| Reference<br>Referencia | Weight/Peso<br>kg/u | u<br>pack |
|-------------------------|---------------------|-----------|
| <b>ROPS</b>             | 0,190               | 1         |
| <b>ROPG</b>             | 0,203               | 1         |

Use 1 TE1070G bolt with 1 C6923.10G lock nut to create configurations with PRC.. profiles.  
Utilizar 1 tornillo TE1070G y 1 tuerca C6923.10G para realizar configuraciones con perfiles PRC..

### Coatings | Acabados:

For wall fixation, use 2 TSOG shims and suitable anchors.  
For fixation to an “Omega” hanging profile, use 2 TCA820G bolts with toothed locknuts. To fix it to a wall mounted “C” profile, use TE835G bolts with TG8G guided locknuts and TSOG shim.

Para fijación a pared, utilizar 2 topes TSOG y tacos apropiados.  
Para la fijación a perfil “Omega” colgante, utilizar 2 tornillos con tuerca-arandela dentada TCA820..  
Para la fijación sobre perfil “C” a pared, utilizar tornillos TE835G con tuerca-guía TG8G y tope TSOG.

**“Omega” profile ceiling support**  
**Soporte “Omega” para techo**

# Elements for supports

## Elementos para soportes

### "C21" profile (41 x 21 mm)

### Perfil "C21" (41 x 21 mm)

Length 3 m  
Largo 3 m

| Reference<br>Referencia | Weight/Peso<br>kg/u | u<br>pack |
|-------------------------|---------------------|-----------|
| PCS                     | 1,73                | 12        |
| PCG                     | 1,90                | 12        |

When using SHE.. or SEC.. supports, fix them with 2 TE1020G bolts and 2 TG10G guided lock nuts.  
When using SO.. supports, fix them with 2 TE835G bolts, 2 TG8G guided lock nuts and 2 TSOG shims.  
En caso de utilizar soportes SHE.. ó SEC.., fijarlos mediante 2 tornillos TE1020G y 2 tuercas guía TG10G.  
En caso de utilizar soportes SO.., fijarlos mediante 2 tornillos TE835G, 2 tuercas guía TG8G y 2 topes TSOG.

### "C21" profile with head plate

### Perfil "C21" con pletina

| Reference<br>Referencia | L    | Weight/Peso<br>kg/u | u<br>pack |
|-------------------------|------|---------------------|-----------|
| PCB50G                  | 500  | 1,62                | 1         |
| PCB100G                 | 1000 | 2,57                | 1         |

When using SHE.. or SEC.. supports, fix them with 2 TE1020G bolts and 2 TG10G guided lock nuts.  
When using SO.. supports, fix them with 2 TE835G bolts, 2 TG8G guided lock nuts and 2 TSOG shims.  
En caso de utilizar soportes SHE.. ó SEC.., fijarlos mediante 2 tornillos TE1020G y 2 tuercas guía TG10G.  
En caso de utilizar soportes SO.., fijarlos mediante 2 tornillos TE835G, 2 tuercas guía TG8G y 2 topes TSOG.

#### Coatings | Acabados:

|   |                                              |

When using SHE.. or SEC.. supports only on one side, fix them with 2 TE1020G bolts and 2 TG10G guided lock nuts.

When using SHE.. or SEC.. supports with even loads on both sides, use 2 TE1070G bolts and 2 C6923.10G guided lock nuts.

When using SO.. supports, fix them with 2 TE835G bolts, 2 TG8G guided lock nuts and 2 TSOG shims.

En caso de utilizar soportes SHE.. ó SEC.., fijarlos mediante 2 tornillos TE1020G y 2 tuercas guía TG10G.

En caso de utilizar soportes SHE.. ó SEC.. con carga equilibrada, utilizar 2 tornillos TE1070G y 2 tuercas C6923.10G.

En caso de utilizar soportes SO.., fijarlos mediante 2 tornillos TE835G, 2 tuercas guía TG8G y 2 topes TSOG.

## Elements for supports Elementos de soporte

### Straight head plate for "C" profiles Cabezal recto para perfiles "C"

| Reference<br>Referencia | Weight/Peso<br>kg/u | u<br>pack |
|-------------------------|---------------------|-----------|
| <b>CPCG</b>             | 1,57                | 1         |

For applications with PC.. profile, use 2 TCA1025G bolts.  
For applications with PRC.. Profile, use 2 TE1070G bolts with 2 C6923.10G lock nuts.

En caso de utilizar perfil PC.., utilizar 2 tornillos TCA1025G.  
En caso de utilizar perfil PRC.., utilizar 2 tornillos TE1070G y 2 tuercas C6923.10G.

### Tiltable head plate for "C41" profile Cabezal inclinable para perfil "C41"

For vertical hanging with inclinations up to 60° in both directions.  
Para péndulos verticales con inclinaciones hasta 60° en ambas direcciones.

| Reference<br>Referencia | Weight/Peso<br>kg/u | u<br>pack |
|-------------------------|---------------------|-----------|
| <b>CICS</b>             | 0,51                | 1         |
| <b>CICG</b>             | 0,58                | 1         |

(1) For predefined configurations with angles of 0°, 15°, 20°, 25°, 30°, 40°, 45° and 60° use 2 TE1070G bolts with C6923.10G toothed lock nuts.

(2) For configurations on mounting holes with angles from -2° to 60° use 1 TE1070G bolt with a C6923.10G lock nut as an axis, plus 2 TCA1020G bolts on the mounting holes (with the lock nuts facing outwards).

(1) Para configuraciones predefinidas con ángulos de -2°, 15°, 20°, 25°, 30°, 40°, 45° y 60°, utilizar 2 tornillos TE1070G con tuercas C6923.10G.

(2) Para configuraciones en colisos con ángulos de -2°, hasta 60°, utilizar 1 tornillo TE1070G como eje con 1 tuerca C6923.10G, juntamente con 2 tornillos TCA1020G en los colisos (con las tuercas orientadas hacia fuera del cabezal).

### Joint for "C41" profile Rótula para perfil "C41"

**NEW  
NOVEDAD**

**Fire resistance: cable trays**  
**Resistencia al fuego: bandejas portacables**

INTERFLEX, S.L. presents its integral solution on cable management for installations that need to resist the effects of a prolonged exposure to fire. Its MULTIVIA range, including its wire-mesh VIAFIL cable tray system and its VIATEC sheet steel cable tray system, have been subject to the most demanding tests to ensure its correct behaviour in case of fire.

*INTERFLEX, S.L. presenta su solución integral para la conducción de cables eléctricos en instalaciones que deben resistir los efectos de una exposición prolongada al fuego. Su gama MULTIVIA, que incluye tanto el sistema de bandejas portacables de rejilla VIAFIL como el de bandejas portacables de acero laminado VIATEC, se ha sometido a los ensayos más exigentes para asegurar su correcto comportamiento en caso de incendio.*

## Introduction

The different safety elements to be found in an installation minimize the effects produced by an incident, preventing higher damages. This is specially important in premises intended for public use where there can be a high number of people, as could be shopping centres, cinemas, theatres, multi-story buildings, hotels, hospitals or closed car-parks, amongst other.

On of the most severe accidents that can occur in this type of installations because of its destructive power are fires. These can cause devastating effects if the safety systems are not adequate, and this is where the electrical cables and its protection and management systems, as for example cable trays, have a key role.

## Introducción

*Los distintos elementos de seguridad presentes en una instalación minimizan los efectos producidos por un incidente, evitando daños mayores. Esto es especialmente importante en locales de pública concurrencia donde puede haber un elevado número de personas, como pueden ser centros comerciales, cines, teatros, edificios de varios pisos, hoteles, hospitales o aparcamientos subterráneos, entre otros.*

*Uno de los accidentes más graves que pueden producirse en este tipo de instalaciones por su poder destructivo son los incendios. Éstos pueden producir efectos devastadores si no se disponen de los sistemas de seguridad adecuados. En este sentido cobran especial importancia los cableados eléctricos y sus sistemas de protección y de conducción, entre ellos las bandejas portacables.*

## Minimizing the fire hazard

The electrical and telecommunications installations must keep the risk under control and assure the operating capacity of the following systems without short circuits or current interruptions on the most critical phases of the fire:

### PHASE 1: Evacuation During the 30 minutes after the fire started

- Emergency lighting
- Fire detection devices
- Alarm and/or warning communications (PA systems)
- Smoke extractors

## Minimizar el riesgo de incendio

*El conjunto de las instalaciones eléctricas y de telecomunicaciones deben mantener la situación de riesgo controlada y asegurar el funcionamiento continuado y sin cortocircuitos de los siguientes sistemas durante las dos fases más importantes de un incendio:*

### FASE 1: Evacuación Durante los 30 minutos después del inicio del incendio

- Alumbrado de emergencia
- Detección de incendio
- Alarma y/o advertencia (megafonía)
- Extracción de humos

## PHASE 2: Fire extinguishing During the 90 minutes after the fire started

- Water pumps
- Fire detection devices
- Smoke extractors
- Fire-fighter lifts and other critical lifts, as for example the ones for hospital tables.

Therefore, the objective is to keep all systems operative for as long as 90 minutes.

To ensure that both VIAFIL and VIA TEC cable tray systems comply with this requirement, INTERFLEX has carried out tests on an homologated and independent laboratory according to the German **DIN 4102-12** standard (**Fire resistance of electric cable systems required to maintain circuit integrity - Requirements and testing**).

## FASE 2: Extinción Durante los 90 minutos después del inicio del incendio

- Instalaciones para el bombeo de agua
- Detección de incendio
- Extracción de humos
- Ascensores de bomberos y otros ascensores críticos como por ejemplo los de camillas en hospitales.

El objetivo, pues, es mantener todos los sistemas operativos durante 90 minutos.

Para asegurar que sus sistemas de conducción de cables VIAFIL y VIA TEC cumplen con dicho requisito, INTERFLEX ha llevado a cabo un ensayo en un laboratorio independiente homologado de acuerdo con la norma alemana **DIN 4102-12** (Resistencia ante el fuego de los sistemas de cables eléctricos para mantener la integridad del circuito-Requisitos y ensayo).

## Why choose the DIN4102-12 standard?

Even though the MULTIVIA range complies with the **IEC 61537** standard (**Cable management-Cable tray systems and cable ladder systems**) and this already includes a section for fire hazard, the requirements included in it are considered insufficient to guarantee the integrity of the safety systems. On the other hand, the **DIN 4102-12** standard reproduces a more realistic situation testing the whole assembly, the cables that need to maintain the energy and signal supply plus the cable management systems. This is the reason why the **DIN 4102-12** standard has become the reference norm to essay the fire behaviour of the cable tray systems.

The result is successful if there are no short circuits or cuts on the current transmitted by the cable. There are several classifications depending on the number of minutes that continuity is preserved:

| Time       | Classification |
|------------|----------------|
| 30 minutes | E30            |
| 60 minutes | E60            |
| 90 minutes | E90            |

The VIAFIL and VIA TEC tray systems, as well as the cables installed, have obtained the **E90** classification, complying with the target of maintaining the systems operative for over 90 minutes.

## ¿Por qué la norma DIN 4102-12?

Aunque la gama MULTIVIA cumple con la norma IEC 61537 (Conducción de cables: Sistemas de bandejas y de bandejas de escalera) y ésta ya contiene una parte referente al riesgo de incendio, los requisitos incluidos en la misma se consideran aún insuficientes para asegurar la integridad de los sistemas que contribuyen a la seguridad. Por el contrario, la norma DIN 4102-12 permite reproducir una situación más realista, ensayando el conjunto compuesto por el sistema de conducción de cables y el cable que debe asegurar y mantener el suministro de energía y señal a los distintos sistemas. Por todo ello, la norma DIN 4102-12 se ha convertido en el estándar de referencia para ensayar el comportamiento frente al fuego de los sistemas de conducción de cables.

El resultado es satisfactorio si no se producen cortocircuitos y no se originan interrupciones en la intensidad transmitida por el cable. Dependiendo del número de minutos durante los cuales se consigue la continuidad, existen varias clasificaciones:

| Tiempo     | Clasificación |
|------------|---------------|
| 30 minutos | E30           |
| 60 minutos | E60           |
| 90 minutos | E90           |

Los sistemas de bandejas VIAFIL y VIA TEC junto con los cables ensayados han obtenido la clasificación E90, lo que permite cumplir el objetivo de mantener todos los sistemas operativos durante 90 minutos.

## Additional considerations

Due to the high temperatures achieved on the test furnace (up to 1000 °C), the cable trays suffer a certain deformation. This is not important as far as the trays keep their supporting capacity during the established time, as this means it preserves its function and doesn't represent a problem for the installation.

It's important to mention that the standard imposes some limitations:

- The tray widths are limited to 400 mm.
- The distance between supports should not exceed 1,2 m.
- The maximum load of cables must be 10 kg/m for all tray sizes.
- The distance between two superposed tray lengths should not be lower than 250 mm.
- The cables are limited to a voltage of 1kV and must have E90 homologation.
- The minimum distance between a cable and the tray side is 30 mm.
- The anchors and fixations must be fireproof.
- The surfaces where the different elements are anchored or fixed must be fireproof.
- If the horizontal test is successful, this means that it's possible to validate installations with the tray inclined or in a vertical position. In this case, it's necessary to fix the cable at least every 3,5 m.

It is important to note that, for this standard, the whole system tested (trays plus cables) will get the most restrictive classification obtained during the essay. For example, if there was a short circuit on the cable between the 30 and 60 minutes of test, the whole system would be E30 even if the cable tray system could maintain its integrity past the 60 minutes.

## Consideraciones adicionales

Debido a las elevadas temperaturas experimentadas en el horno de ensayo (hasta 1000 °C), las bandejas sufren una cierta deformación. Esto no tiene mayor importancia si mantienen su capacidad portante durante el tiempo establecido, ya que significa que continúan cumpliendo su función y por lo tanto no supone un problema para la instalación.

Es importante mencionar que la norma impone una serie de limitaciones:

- La anchura máxima de las bandejas es de 400 mm.
- La distancia entre soportes no deberá superar los 1,2 m.
- La carga máxima de cables es de 10 kg/m en todas las medidas de bandeja.
- La distancia entre tramos de bandeja que transcurren uno encima del otro deberá ser de 250 mm como mínimo.
- Los cables a instalar deben tener una tensión nominal de 1kV como máximo y ser homologados E90.
- La distancia mínima entre un cable y el ala de la bandeja debe ser de al menos 30 mm.
- Los sistemas de anclaje y fijación deberán ser a prueba de fuego.
- Las superficies donde se fijan los distintos elementos deberán ser a prueba de fuego.
- El ensayo satisfactorio realizado en horizontal valida también los montajes de bandeja inclinados o en vertical. En este caso, la única consideración es fijar los cables que discurren sobre la bandeja cada 3,5 m como máximo.

Cabe destacar también que según esta norma el conjunto formado por el sistema de bandejas más los cables obtendrá la clasificación más restrictiva resultante del ensayo. Por ejemplo, si se produjese un fallo en el cable entre los 30 y 60 minutos de prueba, el conjunto sería considerado E30 a pesar que la integridad del sistema de conducción de cables pudiera superar los 60 minutos.

## Advantages of the MULTIVIA cable trays

One of the main advantages of the metal cable trays, which include both VIAFIL and VIATEC systems, is that they avoid the following added hazards in the event of a fire:

- **There is no smoke emission**, and therefore there is no risk of fume inhalation for people.
- **They have no combustible components**, and this prevents the generation of fire outbreaks and also its propagation.

## Ventajas de las bandejas portacables MULTIVIA

Una de las principales ventajas de los sistemas de bandejas portacables metálicas, los cuales incluyen las bandejas VIAFIL y VIATEC, es que evita los siguientes riesgos añadidos en caso de incendio:

- **No emiten humos**, y por lo tanto no existe riesgo de inhalación de gases por parte de las personas. También evita que se formen nubes densas de humo que podrían dificultar los procesos de evacuación y extinción.
- **No tienen componentes combustibles**, lo que evita la generación de focos de incendio y también su propagación.

In the following pages you'll find some installation examples with products that have been homologated E90. For this type of assemblies, the following points must be borne in mind:

- The installations need to have a closed structure
- For a given tray width, the selected support must have the immediately superior size; for example, a 200 mm width tray (R0620G) must use a 300 mm support (SEC30G).
- In some cases there are several references inside a same group (number). You need to choose one of them and use the same product reference for the whole installation.
- When in doubt about the installation needs, please check the product description on the corresponding page.
- The quantities indicated (units or meters) are the recommended ones, but they can be different to adapt the assembly to the installation needs as long as the assembly complies with the E90 considerations indicated in this catalogue.

If you want to make a different assembly from the ones indicated on the examples, please contact with our Technical Assistance service at [asist.tecnica@interflex.es](mailto:asist.tecnica@interflex.es)

*En las siguientes páginas se presentan algunos ejemplos de montaje E90. Para montajes de este tipo deben tenerse en cuenta los siguientes puntos:*

- Las instalaciones deben ser de estructura cerrada.*
- Para un cierto ancho de bandeja, el tamaño de soporte seleccionado debe ser el inmediato superior; p.ej., una bandeja de 200 mm de ancho (R0620G) debe utilizar un soporte de 300 mm (SEC30G).*
- En algunos casos existen varias referencias incluidas dentro de un mismo grupo (número). Se debe seleccionar una de ellas y utilizar la misma en toda la instalación.*
- En caso de duda sobre la configuración del montaje, consultar la descripción de los productos en la página correspondiente.*
- Las cantidades indicadas (unidades o metros) son las recomendadas, pero pueden ser distintas para adaptarse a las necesidades de la instalación siempre y cuando se cumplan las consideraciones para montajes E90 indicadas en el presente catálogo.*

*Si se desea realizar un montaje distinto a los indicados en los ejemplos, contacten con nuestro servicio de Asistencia Técnica en [asist.tecnica@interflex.es](mailto:asist.tecnica@interflex.es)*

## Cable tray installation recommendations

### Ventilation

Electric current transported by cables, specially power cables, generates heat. To prevent temperature generated reaching unwanted levels in cables, cable trays are provided generally with bottom perforations that enable ventilation.

CEI 61537 standard establishes four levels of perforation of base area:

- **Level A:**  
2% maximum perforation.  
Solid bottom **VIATEC** cable trays.
- **Level B:**  
15% maximum perforation.  
Perforated **VIATEC** cable trays from 400 to 600 mm wide.
- **Level C:**  
30% maximum perforation.  
Perforated **VIATEC** cable trays from 100 to 300 mm wide.
- **Level D:**  
perforation over 30%. Wire-mesh **VIAFIL** cable trays.

To increase ventilation it is also recommended to leave a minimum separation of 20 mm between cable trays and the wall where these are supported.

### Layout

Layout of cable trays should preferably follow horizontal and vertical lines, parallel to the edges that limit the place of installation. In any case, a bended cable tray should have a superior bending radius to the one of the cables installed.

### Situation

Cable trays should not be installed under other canalizations that could promote water condensation. They should also be separated to a convenient distance from heat sources (vapour, heating systems,...) unless screens or other devices that prevent their effects are installed as well.

### Accessability

To ease the installation of cables and their maintenance, cable trays should be situated leaving a minimum separation from the ceiling and other elements. When installing covered cable trays, there should be enough space left to cover. When installing several cable trays and uncover the cable tray one above the other, a minimal separation of 300 mm should be left. The highest voltage cables should be situated in the upper cable trays and control and communication cables in the cable trays below.

### Cables

Cable trays are intended to support and accommodate cables. As cable trays do not serve the purpose of protecting cables, it is recommended to have an assigned voltage of 0,6 to 1 KV for the installed cables. Single pole conductors and cables of alternating current circuits installed in ferromagnetic cable trays should be installed having all conductors of each circuit in the same cable tray.

## Recomendaciones para la instalación de bandejas portacables

### Ventilación

*El paso de la corriente eléctrica por los cables, en especial los de potencia, genera calor. Para evitar que el incremento de temperatura generada alcance niveles no deseables en los cables, las bandejas están provistas generalmente de perforaciones en su base que facilitan su ventilación.*

*La norma IEC 61537 establece cuatro niveles de perforación del área de la base:*

- **Nivel A:**  
2% máximo de perforación.  
Nivel de las bandejas **VIATEC** ciegas.
- **Nivel B:**  
15% máximo de perforación. Nivel de las bandejas **VIATEC** perforadas de ancho entre 400 y 600 mm.
- **Nivel C:**  
30% máximo de perforación. Nivel de las bandejas **VIATEC** perforadas de ancho entre 100 y 300 mm.
- **Nivel D:**  
perforación superior al 30%. Nivel de las bandejas **VIAFIL**.

*Para mejorar la ventilación es también recomendable dejar una separación mínima de 20 mm entre las bandejas y la pared en que se apoyan.*

### Trazado

*El trazado de las bandejas se hará siguiendo preferentemente líneas horizontales y verticales, paralelas a las aristas que limitan el local donde se efectúe la instalación. En los cambios de dirección la canalización debe tener un radio de curvatura superior al propio de los conductores instalados.*

### Ubicación

*Las canalizaciones eléctricas no deben situarse debajo de otras canalizaciones que puedan dar lugar a condensaciones de agua. También deben separarse una distancia conveniente en caso de proximidad a conductos calientes sean de vapor, calefacción, etc. a no ser que se instalen pantallas o dispositivos que eviten sus efectos (ver ITC-BT 20, pág. 173).*

### Accesibilidad

*Para facilitar la instalación de los cables y su mantenimiento, las bandejas deben situarse dejando una separación mínima con el techo y otros elementos. En aquellos casos donde se instalen bandejas con tapa deberá dejarse el espacio suficiente para retirarla y volverla a montar (ver ITC-BT 20 pág. 174).*

*Cuando se instalan varias bandejas en altura, la separación entre ellas será de 300 mm como mínimo. Los cables de mayor voltaje se situarán en las bandejas superiores y los de control y comunicaciones en las bandejas inferiores.*

### Cables

*El cometido de las bandejas es el soporte y la conducción de los cables. Debido a que las bandejas no efectúan una función de protección, se recomienda la instalación de cables de tensión asignada 0,6/1KV. Los conductores y cables unipolares de circuitos en corriente alterna instalados en el interior de bandejas de material ferromagnético deben instalarse de manera que todos los conductores de cada circuito se encuentren en la misma bandeja.*

## Selecting the appropriate cable tray

To select the appropriate cable tray, we need to know:

- Selecting the surface treatment.  
Environmental characteristics of the place where it will be installed.
- Load capacity.  
Number, cross section and weight per metre of every cable to be installed.

## Selecting the surface treatment

Steel corrosion is the unwanted conversion of this iron alloy into rust. It has enormous economic consequences, as it damages or makes useless pieces or structures creating great danger and a high cost. To prevent the effects of this corrosion, various coatings, rustproof alloys, paints and polymeric coverings are used. Zinc is the most commonly used metal in these surface treatments, and nickel and chrome are most commonly used in rustproof alloys.

### Zinc coating

Zn thickness on steel pieces varies according to the process used. This thickness and air conditions will have an influence in the persistence of the surface treatment.

The anual loss in  $\mu\text{m}$  for five different environments would be approximately:

- Dry indoors environment 0,5  $\mu\text{m}$
- Rural environment 1,9  $\mu\text{m}$
- Urban environment 3,5  $\mu\text{m}$
- Marine environment 4,7  $\mu\text{m}$
- Industrial environment 10,1  $\mu\text{m}$

### MULTIVIA protection materials:

#### Z3 Zinc electroplating

Electrolytic zinc coating on steel with an average thickness of 10  $\mu\text{m}$ . Later it gets a passivating treatment with trivalent chrome salts ( $\text{Cr}3+$ ) (according to UNE-EN 12329:2001). This coating complies the European Directive 2002/95/CE (RoHS) and the later modifications 2005/618/CE, 2005/717/CE and 2005/747/CE, being free of hexavalent chrome and of any kind of colorant.

Used in wire-mesh cable trays and accessories.

#### S Sendzimir galvanized

Coating obtained by continuous immersion of the rolled sheet steel into a zinc bath with zinc purity equal or superior to 99%, later removing the excess of adhered zinc. The coating thickness ranges from 15 to 20  $\mu\text{m}$  (according to UNE-EN 10327:2007). Subsequent cuttings and punchings will be protected against corrosion as well, thanks to a zinc hydroxide cover formed by anodic diffusion.

Used in sheet steel cable trays and accessories.

## Selección de la bandeja adecuada

Para la selección de la bandeja adecuada debemos conocer:

- Selección del recubrimiento.  
Características medioambientales del lugar en qué será instalada la bandeja.
- Capacidad de carga.  
Número, sección y peso por metro de cada uno de los cables a instalar.

## Selección del recubrimiento

La corrosión del acero es la conversión no deseada de esta aleación de hierro en herrumbre. Tiene una gran trascendencia económica al dañar o inutilizar piezas y estructuras con un peligro evidente y un coste elevado. Para prevenir los efectos de esta corrosión se utilizan tratamientos superficiales, aleaciones inoxidables, pinturas y recubrimientos poliméricos. El cinc es el metal más utilizado en los tratamientos superficiales, y el níquel y el cromo en las aleaciones inoxidables.

### Cincado

El espesor de cinc sobre las piezas de acero varían según el proceso utilizado. Según este espesor y las condiciones del aire ambiental presente en el lugar de la instalación variará el tiempo de protección del recubrimiento.

La pérdida anual en  $\mu\text{m}$  para cuatro ambientes distintos sería aproximadamente la siguiente:

- Ambiente interior seco 0,5  $\mu\text{m}$
- Ambiente rural 1,9  $\mu\text{m}$
- Ambiente urbano 3,5  $\mu\text{m}$
- Ambiente marino 4,7  $\mu\text{m}$
- Ambiente industrial 10,1  $\mu\text{m}$

### Protección de los materiales MULTIVIA:

#### Z3 Cincado electrolítico

Recubrimiento electrolítico de cinc sobre el acero con un espesor medio de recubrimiento de 10  $\mu\text{m}$ . Posteriormente se pasiva con sales de cromo trivalente ( $\text{Cr}3+$ ) (s/ UNE-EN 12329:2001). Este acabado cumple con las Directivas Europeas 2002/95/CE (RoHS) y las posteriores modificaciones 2005/618/CE, 2005/717/CE y 2005/747/CE y está exento de cromo hexavalente y de cualquier tinte colorante.

Utilizado en bandejas de rejilla y accesorios.

#### S Galvanizado senzimir

Recubrimiento obtenido por inmersión en continuo del acero laminado en un baño de cinc de pureza igual o superior al 99% de cinc eliminándose posteriormente el exceso de cinc adherido. El espesor de recubrimiento oscila entre 15 y 20  $\mu\text{m}$  (s/ UNE-EN 10327:2007). En los cortes y troquelados posteriores al galvanizado de las bandas de pequeño espesor utilizadas, las zonas sin recubrimiento quedan también protegidas de la corrosión por una capa de hidróxido de cinc formada por difusión anódica.

Utilizado en bandejas de acero laminado y accesorios.

#### **G Hot dip galvanizing**

Coating obtained by immersion into a zinc bath at a temperature between 450 and 460 °C. The coating thickness depends on the thickness of the material to be galvanized, and according to the UNE-EN ISO 1261:99 the standard thickness ranges between 45 µm for a piece thickness under 1.5mm and 85 µm for a piece thickness over 6mm. The coating is made up of different Fe and Zn alloy layers strongly bound to the steel and a superficial zinc cover all together becoming an excellent barrier against corrosion.

*Used in sheet steel and wire-mesh cable trays as well as in accessories.*

#### **MULTIVIA other materials:**

##### **I Stainless steel**

Numerous products of our catalogue are supplied in steel no.14301 according to EN 10088 (AISI 304) with excellent resistance characteristics to corrosion in indoors, aggressive outdoors, highly humid (industrial, chemical, marine,...) and aseptic environments (specially indicated for alimentary industry). Upon request, we can also provide wire-mesh cable trays and accessories in steel no.14404 (AISI 316L) with excellent resistance to corrosion (specially indicated for chemical industry).

*Used in wire-mesh cables trays and accessories.*

##### **HR High resistant finish**

Coating based on a thick layer of zinc, trivalent chrome (Cr3+) and a special sealer that offers a very high corrosion resistance, exceeding 1000 hours without the appearance of red corrosion on the salt spray test according to EN ISO 10289. This coating complies with the European Directive 2002/95/CE (RoHS) and the later modification 2011/65/EU, being free of hexavalent chrome.

*Used in wire-mesh cable trays.*

##### **E Epoxy-Polyester painting**

Finish obtained by the application of a powder coating applied through an electrostatic spray gun and oven polymerization. A treatment of degreasing, phosphatizing, cleaning and drying has been applied previously to achieve a good surface finish. The average coating thickness varies between 60 and 90 µm (according to DIN-EN ISO 2360:2004).

The epoxy-polyester coating is especially indicated to be used in indoor applications, while the polyester finish is recommended for outdoor applications. Both can be ordered in any RAL existing in the colour palette.

*Used in sheet steel and wire-mesh cable trays as well as in accessories.*

According to environmental characteristics of the place where the cable tray will be installed, the most appropriate material or surface treatment is chosen in accordance to the recommendations of table 1.

#### **G Galvanizado en caliente**

Recubrimiento obtenido por inmersión en un baño de cinc entre 450 y 460°C. El espesor de recubrimiento depende del espesor del material a galvanizar y según UNE-EN ISO 1261:99 el espesor estándar varía entre 45 µm para un espesor de la pieza inferior a 1,5mm y 85 µm para piezas cuyo grosor es superior a 6 mm. El recubrimiento está formado por diferentes capas de aleación de Fe y Zn fuertemente unidas a la capa superficial de cinc formando una excelente barrera contra la oxidación. Utilizado en bandejas de acero laminado, bandejas de rejilla y accesorios.

#### **Otros materiales MULTIVIA:**

##### **I Acero inoxidable**

Numerosos productos de nuestro catálogo se suministran en acero inoxidable nº 14301 s/ EN 10088 (AISI 304) por sus excelentes características de resistencia a la corrosión en presencia de ambientes interiores y exteriores agresivos y con un alto grado de humedad y por sus características asépticas (especialmente idóneas para la industria alimentaria). También se suministra en acero nº 14404 (AISI 316L) por su excelente resistencia a la corrosión (especialmente en la industria química). Utilizado en bandejas de rejilla y accesorios.

##### **HR Acabado de alta resistencia**

Tratamiento con un elevado espesor de capa de cinc, cromo trivalente (Cr3+) y un sellante especial que proporciona una resistencia muy elevada a la corrosión, superando las 1000 horas sin aparición de corrosión roja en el ensayo de niebla salina de acuerdo con la norma EN ISO 10289.

Este acabado está de acuerdo con la Directiva Europea 2002/95/CE (RoHS) y su posterior modificación 2011/65/EU siendo exento de cromo hexavalente.

*Utilizado en las bandejas de rejilla.*

##### **E Epoxy-Polyester painting**

Acabado obtenido por aplicación de recubrimiento en polvo mediante pistolas electrostáticas y su posterior polimerización en horno. Previamente se realiza un tratamiento de desengrase-fosfatado, lavado y secado para conseguir un buen acabado superficial. El espesor de recubrimiento varía entre los 60 y los 90 µm (según UNE-EN ISO 2360:2004).

El recubrimiento de epoxy-poliéster es indicado para uso en interiores, mientras que el de poliéster está especialmente pensado para ser utilizado en aplicaciones en intemperie. Ambos se pueden solicitar en cualquier RAL existente en la carta de colores.

*Utilizado en bandejas de acero laminado, bandejas de rejilla y accesorios.*

Conocidas las características medioambientales donde se instalará la bandeja, se escogerá el recubrimiento más adecuado siguiendo las indicaciones de la tabla 1.

\* Values obtained without cuts on the tray

## Load capacity

### Load capacity diagrams

The permissible load diagrams have been obtained experimentally in our laboratory according to CEI 61537:2001 standard and load limitations determined by:

1. Maximum longitudinal deflection = 1/100 of the span between supports
2. Maximum transversal deflection = 1/20 of cable tray width
3. With the joint of two cable trays placed approximately at 1/5 of the span between supports (null flexor moment). We discard, therefore, joints of two cable trays in the middle of the span between supports or on the support.
4. The values established are for uniformly distributed loads and excluding any type of isolated loads (as the weight of a worker).
5. Safety coefficient = 1,7

Diagrams indicate the permissible loads in N/m (1N ~ 0,1Kg) for a certain type of cable tray depending on the span between supports and are formed by a horizontal section that represents the load of the different cable trays at their limit of full load capacity with cables. The load has been calculated having in consideration the useful cross section of the cable tray (width x interior height) and an average density of 0,025 N/mm<sup>2</sup> per metre of the copper power cable set (copper+insulating material+air interstices).

A second section formed by a descending curve (only on those affected diagrams) represents the maximum load that can withstand the cable tray with the limitations mentioned above.

### Number of cables and section

It's the first factor that determines the dimensions of the cable trays to be installed. With this data it is possible to calculate the useful cross section that the cables would occupy in the tray as indicated as follows.

**Tabla 1. Selección del tratamiento superficial**

\* Valores obtenidos sin cortes en la bandeja

## Capacidad de carga

### Diagramas de capacidad de carga

Los diagramas de cargas admisibles se han obtenido experimentalmente en nuestro laboratorio siguiendo las directrices de la norma CEI EN 61537 y las limitaciones de carga determinadas por:

1. Flecha longitudinal máxima = 1/100 de la distancia entre soportes
2. Flecha transversal máxima = 1/20 de la anchura de la bandeja
3. Con la unión entre bandejas situada aproximadamente a 1/5 de la distancia entre soportes (momento flexor nulo). Se descartan, por consiguiente, uniones en el punto medio entre soportes y uniones sobre el mismo soporte.
4. Los valores se entienden por cargas uniformemente repartidas y excluyendo cualquier tipo de carga puntual, como podría ser el peso de un operario.
5. Un coeficiente de seguridad = 1,7

Los diagramas indican las cargas admisibles en N/m (1N ~ 0,1Kg) para cada tipo de bandeja en función de la distancia entre soportes y están formados por un tramo horizontal que representa la carga de las distintas bandejas al límite de su capacidad de llenado con cables, calculada teniendo en cuenta la sección de la bandeja (ancho x alto interiores) y que el peso medio de los cables de cobre situados en la misma es de 0,025 N/mm<sup>2</sup> por metro.

Un segundo tramo en forma de curva descendente (sólo en los diagramas afectados) representa la carga máxima que puede soportar la bandeja en este punto.

### Número de cables y sección

Son el primer factor que determina las dimensiones de las bandejas a instalar. Con estos datos se puede calcular la sección útil que ocuparían los cables en la bandeja tal como se indica a continuación.

### Calculating useful cross section

Useful cross section of cable trays is obtained using the following formula:

$S_u \text{ (mm}^2\text{)} = C \times R \times S \text{ (mm}^2\text{)}$  where:

$S_u$  = minimum useful section needed

$C$  = Filling coefficient. This coefficient takes into account both the incapacity to fill completely the section of the cable tray and the need to leave enough space for cable ventilation.

$C = 1,25$  for control cables

$C = 1,45$  for power cables

$R$  = Space reserve coefficient. This coefficient takes into account the possible future installation of more cables in the cable tray. Recommended values are:  
 $R = 1,20$  to  $1,30$

$S$  = Added section (conductor+insulator) of all cables being installed.

The appropriate size of the cable tray can be ascertained by comparing the value of  $S_u$  with values of useful cross sections of cable trays.

We should verify that the chosen size is adequate to support the weight of cables given the existing or planned span between supports.

### Number of cables and weight

It's the second factor that determines the dimensions of the trays to be installed and defines the distance between supports ( $L$ ).

#### Couplers

For a correct installation, it is important to correctly place the couplers according to the supports' position. The optimal location is found at  $1/5$ th of the span between supports. In any case, it is never advised to place the couplers right over the supports or right in between two supports.

### Calculating cable tray permissible load

Permissible load of cable trays is obtained using the following formula:

$L_{perm} \text{ (N/m)} = 10 \times R \times W \text{ (Kg/m)}$  where:

$L_{perm}$  = Permissible Load

$R$  = Space reserve coefficient. It will be the same value used for the calculations of  $S_u$ . ( $R = 1,20$  to  $1,30$ )

$W$  = Added weights per lineal metre of all cables being installed.

Looking at the load capacity diagram of the chosen cable tray, we will make sure that the value of the permissible load calculated ( $L_{perm}$ ) is below the horizontal line of maximum filling capacity of this cable tray and, if no maximum load capacity curve exists that limits the span between supports, this span will be 2 metres maximum.

### Cálculo de la sección útil

Se obtiene aplicando la fórmula siguiente:

$S_u \text{ (mm}^2\text{)} = C \times R \times S \text{ (mm}^2\text{)}$  donde:

$S_u$  = sección útil mínima necesaria

$C$  = Coeficiente de llenado. Este coeficiente tiene en cuenta tanto la incapacidad de llenar completamente la sección útil de la bandeja, como la necesidad de dejar un espacio suficiente para la refrigeración de los cables.

$C = 1,25$  para cables de mando

$C = 1,45$  para cables de potencia

$R$  = Coeficiente de reserva de espacio. Este coeficiente tiene en cuenta la posible futura instalación de más cables en la bandeja. Se aconsejan valores comprendidos entre:  
 $R = 1,20$  a  $1,30$

$S$  = Suma de las secciones (conductor+aislante) de todos los cables a instalar.

Comparando el valor de  $S_u$  con un valor similar en la columna de secciones útiles de cada tipo de bandeja, podremos elegir el tamaño de bandeja adecuado.

Finalmente deberemos comprobar si la bandeja elegida es adecuada para soportar el peso de los cables a la distancia entre soportes prevista.

### Número de cables y peso

Son el segundo factor que determina las dimensiones de las bandejas a instalar y define la distancia a la que se deberán colocar los soportes ( $L$ ).

#### Uniones

Para una correcta instalación, es importante ubicar de manera adecuada el punto de unión entre tramos de bandeja en relación a los soportes. La posición óptima de la unión se encuentra a  $1/5$  parte de la distancia entre soportes. En cualquier caso debe evitarse colocar la unión justo encima de un punto de soporte así como colocarla en el punto medio de la distancia entre soportes.

### Cálculo de la carga admisible

Se obtiene aplicando la fórmula siguiente:

$C_{adm} \text{ (N/m)} = 10 \times R \times P \text{ (Kg/m)}$  donde:

$C_{adm}$  = Carga admisible

$R$  = Coeficiente de reserva de espacio. Se elegirá el mismo valor utilizado para el cálculo de  $S_u$ . ( $R = 1,20$  a  $1,30$ )

$P$  = Suma de los pesos por metro lineal de cada uno de los cables a instalar.

Con el valor de la carga admisible  $C_{adm}$  y situados frente al diagrama de cargas de la bandeja elegida comprobaremos que la carga admisible calculada se sitúa por debajo de la línea horizontal de máxima capacidad de llenado de esta bandeja y, si no existe en el diagrama ningún tramo de la curva de máxima capacidad de carga que pueda limitarnos la distancia entre soportes, ésta podrá ser de 2 metros como máximo.

## Calculation example

We are looking for a perforated sheet steel cable tray to house the cables in these quantities and with these manufacturer specifications:

| Qty of cables                                       | Nominal section (mm <sup>2</sup> ) | External diameter (mm) | External section (mm <sup>2</sup> ) | Total section (mm <sup>2</sup> ) | Weight (Kg/m) | Total Weight (Kg/m) |
|-----------------------------------------------------|------------------------------------|------------------------|-------------------------------------|----------------------------------|---------------|---------------------|
| 4                                                   | 1x4                                | 7,2                    | 41                                  | 164                              | 0,087         | 0,348               |
| 3                                                   | 4x6                                | 17,2                   | 232                                 | 696                              | 0,516         | 1,548               |
| 8                                                   | 4x70                               | 35,5                   | 990                                 | 7.920                            | 3,574         | 28,592              |
| 6                                                   | 3x150                              | 44,9                   | 1.583                               | 9.498                            | 5,550         | 33,300              |
| <b>S = 18.278 mm<sup>2</sup>    W = 63,788 Kg/m</b> |                                    |                        |                                     |                                  |               |                     |

Assuming that we want to reserve 20% of the space (R=1,20), and appreciating that most of the cables are power cables (C=1,40), the minimum useful cross section needed will be:

$$S_u = 1,40 \times 1,20 \times 18.278 \text{ mm}^2 = 30.707 \text{ mm}^2$$

Amongst the different cable tray sizes for this useful cross section, the ones closest to our calculated value to excess are the ones measuring 60x600, 85x400 and 110x300 mm.

| Reference     | Side mm    | Width mm   | Useful cross section (mm <sup>2</sup> ) |

|               |            |            |                                         |
| P1010S        | 110        | 100        | 10.120                                  |
| P1015S        | 110        | 150        | 15.520                                  |
| P1020S        | 110        | 200        | 20.920                                  |
| <b>P1030S</b> | <b>110</b> | <b>300</b> | <b>31.720</b>                           |
| P1040S        | 110        | 400        | 42.520                                  |
| P1050S        | 110        | 500        | 53.320                                  |
| P1060S        | 110        | 600        | 64.120                                  |

The permissible load in N/m (1N ~ 0,1Kg) will be:

$$L_{perm} = 10 \times 1,20 \times 63,788 \text{ Kg/m} = 765 \text{ N/m}$$

In accordance to the permissible load capacity diagrams, the longest span between supports would be 2 metres. With the first mm cable tray, ventilation is highly efficient, though it takes up too much space; with the second cable tray space and ventilation are balanced and with the third ventilation is not optimal.

## Ejemplo de cálculo

Deseamos determinar una bandeja perforada para alojar el número de cables y de características según el fabricante, que se indican a continuación:

| Nº cables                                        | Sección nominal (mm <sup>2</sup> ) | Diámetro exterior (mm) | Sección exterior (mm <sup>2</sup> ) | Total sección (mm <sup>2</sup> ) | Peso (Kg/m) | Total peso (Kg/m) |
|--------------------------------------------------|------------------------------------|------------------------|-------------------------------------|----------------------------------|-------------|-------------------|
| 4                                                | 1x4                                | 7,2                    | 41                                  | 164                              | 0,087       | 0,348             |
| 3                                                | 4x6                                | 17,2                   | 232                                 | 696                              | 0,516       | 1,548             |
| 8                                                | 4x70                               | 35,5                   | 990                                 | 7.920                            | 3,574       | 28,592            |
| 6                                                | 3x150                              | 44,9                   | 1.583                               | 9.498                            | 5,550       | 33,300            |
| <b>S=18.278 mm<sup>2</sup>    P= 63,788 Kg/m</b> |                                    |                        |                                     |                                  |             |                   |

Como apreciamos que la mayoría de cables son de potencia (estimamos un valor promedio de C=1,40) y si nos interesa reservar un 20% de espacio (R=1,20) la sección útil será:

$$S_u = 1,40 \times 1,20 \times 18.278 \text{ mm}^2 = 30.707 \text{ mm}^2$$

De acuerdo con la columna de sección útil podemos escoger las bandejas de 60x600 mm, 85x400 mm y 110x300 mm como puede apreciarse, a modo de ejemplo, en la siguientes tablas.

| Referencia | Ala mm | Ancho mm | Sección útil (mm <sup>2</sup> ) |
|------------|--------|----------|---------------------------------|

La carga admisible en N/m (1N ~ 0,1Kg) será:

$$C_{adm} = 10 \times 1,20 \times 63,788 \text{ Kg/m} = 765 \text{ N/m}$$

De acuerdo con los diagramas de capacidad de carga admisible de estas bandejas la mayor distancia entre soportes podría ser de 2 metros. Con la primera bandeja tendremos una ventilación muy eficiente a costa de ocupar un gran espacio, con la segunda se equilibran espacio y ventilación, con la tercera primamos el espacio con respecto a la ventilación.

## Electrical continuity and ground connection

Metallic cable tray systems should present an adequate electrical continuity to ensure an equipotential connection and one or many ground connections if necessary (CEI 61537-01).

According to continuity assay no. 11.1 of CEI 61537-01 values of impedance in **MULTIVIA** cable trays and joining materials do not exceed 50 mΩ through the union of two cable trays and 5 mΩ per metre of cable tray without the union.

Ground connection of a cable tray system is achieved connecting all elements of the system (every cable tray and all accessories) to a copper conductor with cover with a section not inferior to 16 mm<sup>2</sup>. When using wire-mesh cable trays, this connection can be made with BTL grounding clamp (page 21 in this catalogue) and when using sheet steel cable trays, it can be made with FSR.. clamps (page 63 in this catalogue).

## Continuidad eléctrica y conexión a tierra

Los sistemas de bandejas metálicas deben presentar una continuidad eléctrica adecuada para asegurar una conexión equipotencial y una o varias conexiones a tierra si son requeridas (CEI EN 61537-01).

Pero en la Guía Técnica de Aplicación (Guía BT-20 pág.13) se concreta que las bandejas metálicas deben conectarse a la red de tierra quedando su continuidad eléctrica convenientemente asegurada.

De acuerdo con el ensayo 11.1 de continuidad según (CEI EN 61537-01) los valores de impedancia en las bandejas y materiales de unión de MULTIVIA no exceden 50 mΩ a través de la unión y de 5 mΩ por metro de bandeja sin la unión.

La puesta a tierra del sistema de bandejas se efectúa conectando todos los elementos del sistema (todas las bandejas y todos los accesorios) a un cable de cobre con envoltorio de sección adecuada no inferior a 16 mm<sup>2</sup> (ITC-BT 18 pág. 156).

La conexión en bandejas de rejilla puede realizarse con el borne BTL (pág. 21 de este catálogo) y en bandejas de acero laminado con la brida de fijación FSRG (pág. 63).
